تمرین سری اول درس سیستمهای عامل پیشرفته

پارسا محمدیان – ۹۸۱۰۲۲۸۴ ۲۴ فروردین ۱۴۰۲

تئوري

١

از آنجایی که در مجموع

 $4 \times 20 \times 2 = 160$

ریسمان می تواند در سیستم به صورت همزمان اجرا شود، این ۲۵۶ ریسمان باید در دو نوبت اجرا شوند. در هر نوبت آدرسهایی که allocate می شوند در TLB Shootdown ذخیره می شوند و سپس با TLB Shootdown با ناک می شوند. تعداد این TLB Shootdown IPIها باید برابر تعداد bdeallocate باشد یعنی برابر با عدد زیر.

$$10^6 \times 256 = 2^20 \times 2^8 = 2^{28}$$

برای کاهش این عدد می توانیم قبل از deallocate کردن، یک دور instruction مربوط به TLB مربوط به Shootdown را اجرا میکنیم. اینگونه فاکتور تعداد deallocate از ضرب بالا حذف می شوند.

عملي

١

1.1

1.1.1

کد مربوط به این بخش در فایل 1.1.c موجود است. همچنین اسکریپت اجرای آن در فایل 1.1.sh قرار دارد.

در تصویر زیر مشاهده میکنیم که اسکریپت اجرا شده است. خروجی کامل اسکریپت را در ادامه میبینیم.

شکل ۱: خروجی اجرای اسکریپت

```
